Leading Web Security Provider Blue Coat Uses MadCap Flare to Bring Award-Winning Innovations to Responsive HTML5-Based Product Guides

GOALS

- Deliver topic-based PDFs and multimedia web guides that are more intuitive and make it easier for users to navigate and find the information they need.
- Support the broad range of devices users rely on to access Blue Coat's online guides—from desktops and notebooks to mobile phones and tablets.
- Facilitate more efficient development and delivery of Blue Coat's guides through content re-use and single-source, multichannel publishing.

SOLUTIONS

- MadCap Flare native XML single-source content authoring software

BENEFITS

- **Efficiency** — Topic-based single-source publishing facilitates content reuse and streamlines delivery of multiple guides as online Help and PDFs.
- **Easy Customization** — Variables, cascading style sheets and skins enable Blue Coat to customize content, as well as the look and feel, for different versions of its documentation for the company and OEMs.
- **Innovation** — Snippets, top navigation and drop-down text in Flare enabled Blue Coat to think out of the box in creating an intuitive deployment mode wizard without software programming.
- **Intuitive User Experience** — Responsive design and top navigation provide a modern Web experience for desktop and mobile users, alike. Links to PDFs and training videos on YouTube within web guides let users learn the way they want to.

Blue Coat Systems, recently acquired by Symantec, provides advanced web security solutions for global enterprises and governments—offering protection against cyber threats on the network, on the web, in the cloud and on mobile devices.

To help customers deploy its security solutions quickly and effectively, Blue Coat delivers a range of guides. Today, Blue Coat relies on the single-source, multi-channel publishing functionality of MadCap Flare to deliver these guides both as PDFs and as responsive HTML5 Help that automatically adjusts to users’ screens, from desktops to mobile devices.

The Blue Coat technical writing team also turned to MadCap Flare to drive innovative new ways of assisting users. Most notable is an award-winning, interactive web-based wizard that directs each user through the right deployment process for his or her solution. This deployment mode wizard was developed by Rebecca Altman, a principal technical writer at Blue Coat. Her project, developed in Flare 11, won the Distinguished Award in the Society of Technical Communications competition in 2016.

Rethinking Documentation Delivery

For years, Blue Coat employed Adobe® FrameMaker® to produce traditional PDFs, including in-depth solution guides and quick-start manuals. Then by using WebWorks, the company converted these longer solution guides into online documentation. However, as the company’s product line continued to grow, so too did the number and size of the guides required to support the solutions. Blue Coat realized the need for a more efficient approach to creating and delivering content.

“Our documents were getting very lengthy – in some cases up to 2,000 pages,” recalled Chris Freeman, senior technical writer at Blue Coat. “It was an ineffective way of developing content and was overwhelming for customers to look through.”

To zero in on how to better serve customers’ needs, Blue Coat technical writers interviewed

customers during on-site training to get feedback about the usability of the guides. Those users’ responses confirmed the concerns that the guides were too large and complicated to navigate. Customers wanted an easier and quicker way to search for information.

With user feedback in hand, the Blue Coat team decided to move away from creating large, linear book-style guides to creating topic-based content. Not only would it be easier for users to find the information they needed; it would also allow topics to be reused in different contexts in print and online.

New business development at Blue Coat in 2008 also translated into the need to approach its guides differently. Until then, Blue Coat was delivering security appliances, but that year the company began rolling out its first cloud security service to complement their on-premises offerings. Now Web-based Help that worked with the cloud service would be as important as providing PDF guides.

A search of software that supported topic-based authoring and single-source publishing to online and print outputs quickly led Blue Coat writers to MadCap Flare.

“We attended a MadCap roadshow, and saw that Flare could do what we wanted it to do,” Freeman said. “Additionally, we had flirted with the idea of using XML, but only when we found Flare did we see a software package that provided a compelling interface on top of the XML functionality.”

Visually Enhancing the Customer Experience

Today, Blue Coat’s technical writers take advantage of features in MadCap Flare to create dynamic, topic-based web guides for its security solutions. One of the largest projects supports the cloud-based Blue Coat Web Security Service. There MadCap Flare is used to produce four web guides covering deployment, solutions, hosting, and release notes. Complementing the web guides are targeted PDFs covering specific topics, which are delivered using the single source, multi-channel publishing capabilities of MadCap Flare.

With the focus on delivering web guides that complement the Blue Coat Web Security Service, three other features have played an important role: responsive design, integrated video, and a search bar.

Blue Coat was one of the first companies to take advantage of the HTML5 responsive design functionality first delivered with MadCap Flare 10. Using this feature, Blue Coat has been able to create web guides that automatically adjust to users’ screens—from large desktop monitors, to notebooks, tablets and smart phones.

“The HTML5 responsive design feature in Flare is fantastic. With a single output, I can produce content that looks great on smartphones and tablets, as well as laptops,” said Freeman. “This is important given how many people view everything on mobile devices today.”

The HTML5 responsive design feature in Flare is fantastic. With a single output, I can produce content that looks great on smartphones and tablets, as well as laptops.

CHRIS FREEMAN

Senior Technical Writer | Blue Coat Systems, Inc.

The Blue Coat web guides also rely on MadCap Flare's ability to embed links to training videos that the company has published on YouTube, as well as to the targeted PDFs.

"Being able to embed multimedia links with Flare is a great feature for giving users everything they need on one page," Freeman noted. "For example, if I am a customer on our content filtering solution landing page, I can not only read about the solution but also watch a YouTube video or download a PDF with a single click."

Additionally, using MadCap Flare, Blue Coat provides a Google-like search bar on every page of the guide. This allows customers to easily search terms and quickly get to the topic they want.

Fostering Innovation and Customization

The Blue Coat team also relies on features in MadCap Flare to foster innovation and support customization. Among these are top navigation, variables, skins, cascading style sheets, and master projects.

In 2015, new functionality in Flare 11 allowed Blue Coat to move away from the traditional tripane format of online Help sites to the frameless top navigation output for HTML5 that looks more like a modern website.

"Using top navigation with Flare, we have achieved a cleaner, more standard web-based layout that looks a lot better," Freeman said. "Interestingly, Flare also has led us to a way of thinking about how to make guides and content more concise. We're able to create more landing-type pages that lead users to a specific topic, instead of overwhelming them with one lengthy page."

Blue Coat also relies on a combination of skins and variables created with MadCap Flare to customize different product guides for Blue Coat's original equipment manufacturers (OEMs) who white label the solution.

"With Flare, I just create parent-child variables for other company and product names, customize additional skins, and add some minimal CSS for background colors where needed," Freeman explained. "This absolutely saves me lots of time because I generate all of those outputs from one project. I am able to generate not only the Blue Coat output but the other OEM vendors as well in under 30 minutes."

Additionally, Master projects enable other Blue Coat technical writers to take advantage of innovations from other team members and apply them to their own guides, using CSS editing to customize and arrange content as needed.

"With master projects and CSS editing, our team can focus more on creating enriching content to help users focus on solutions instead of constantly formatting and reformatting like before," noted Freeman.

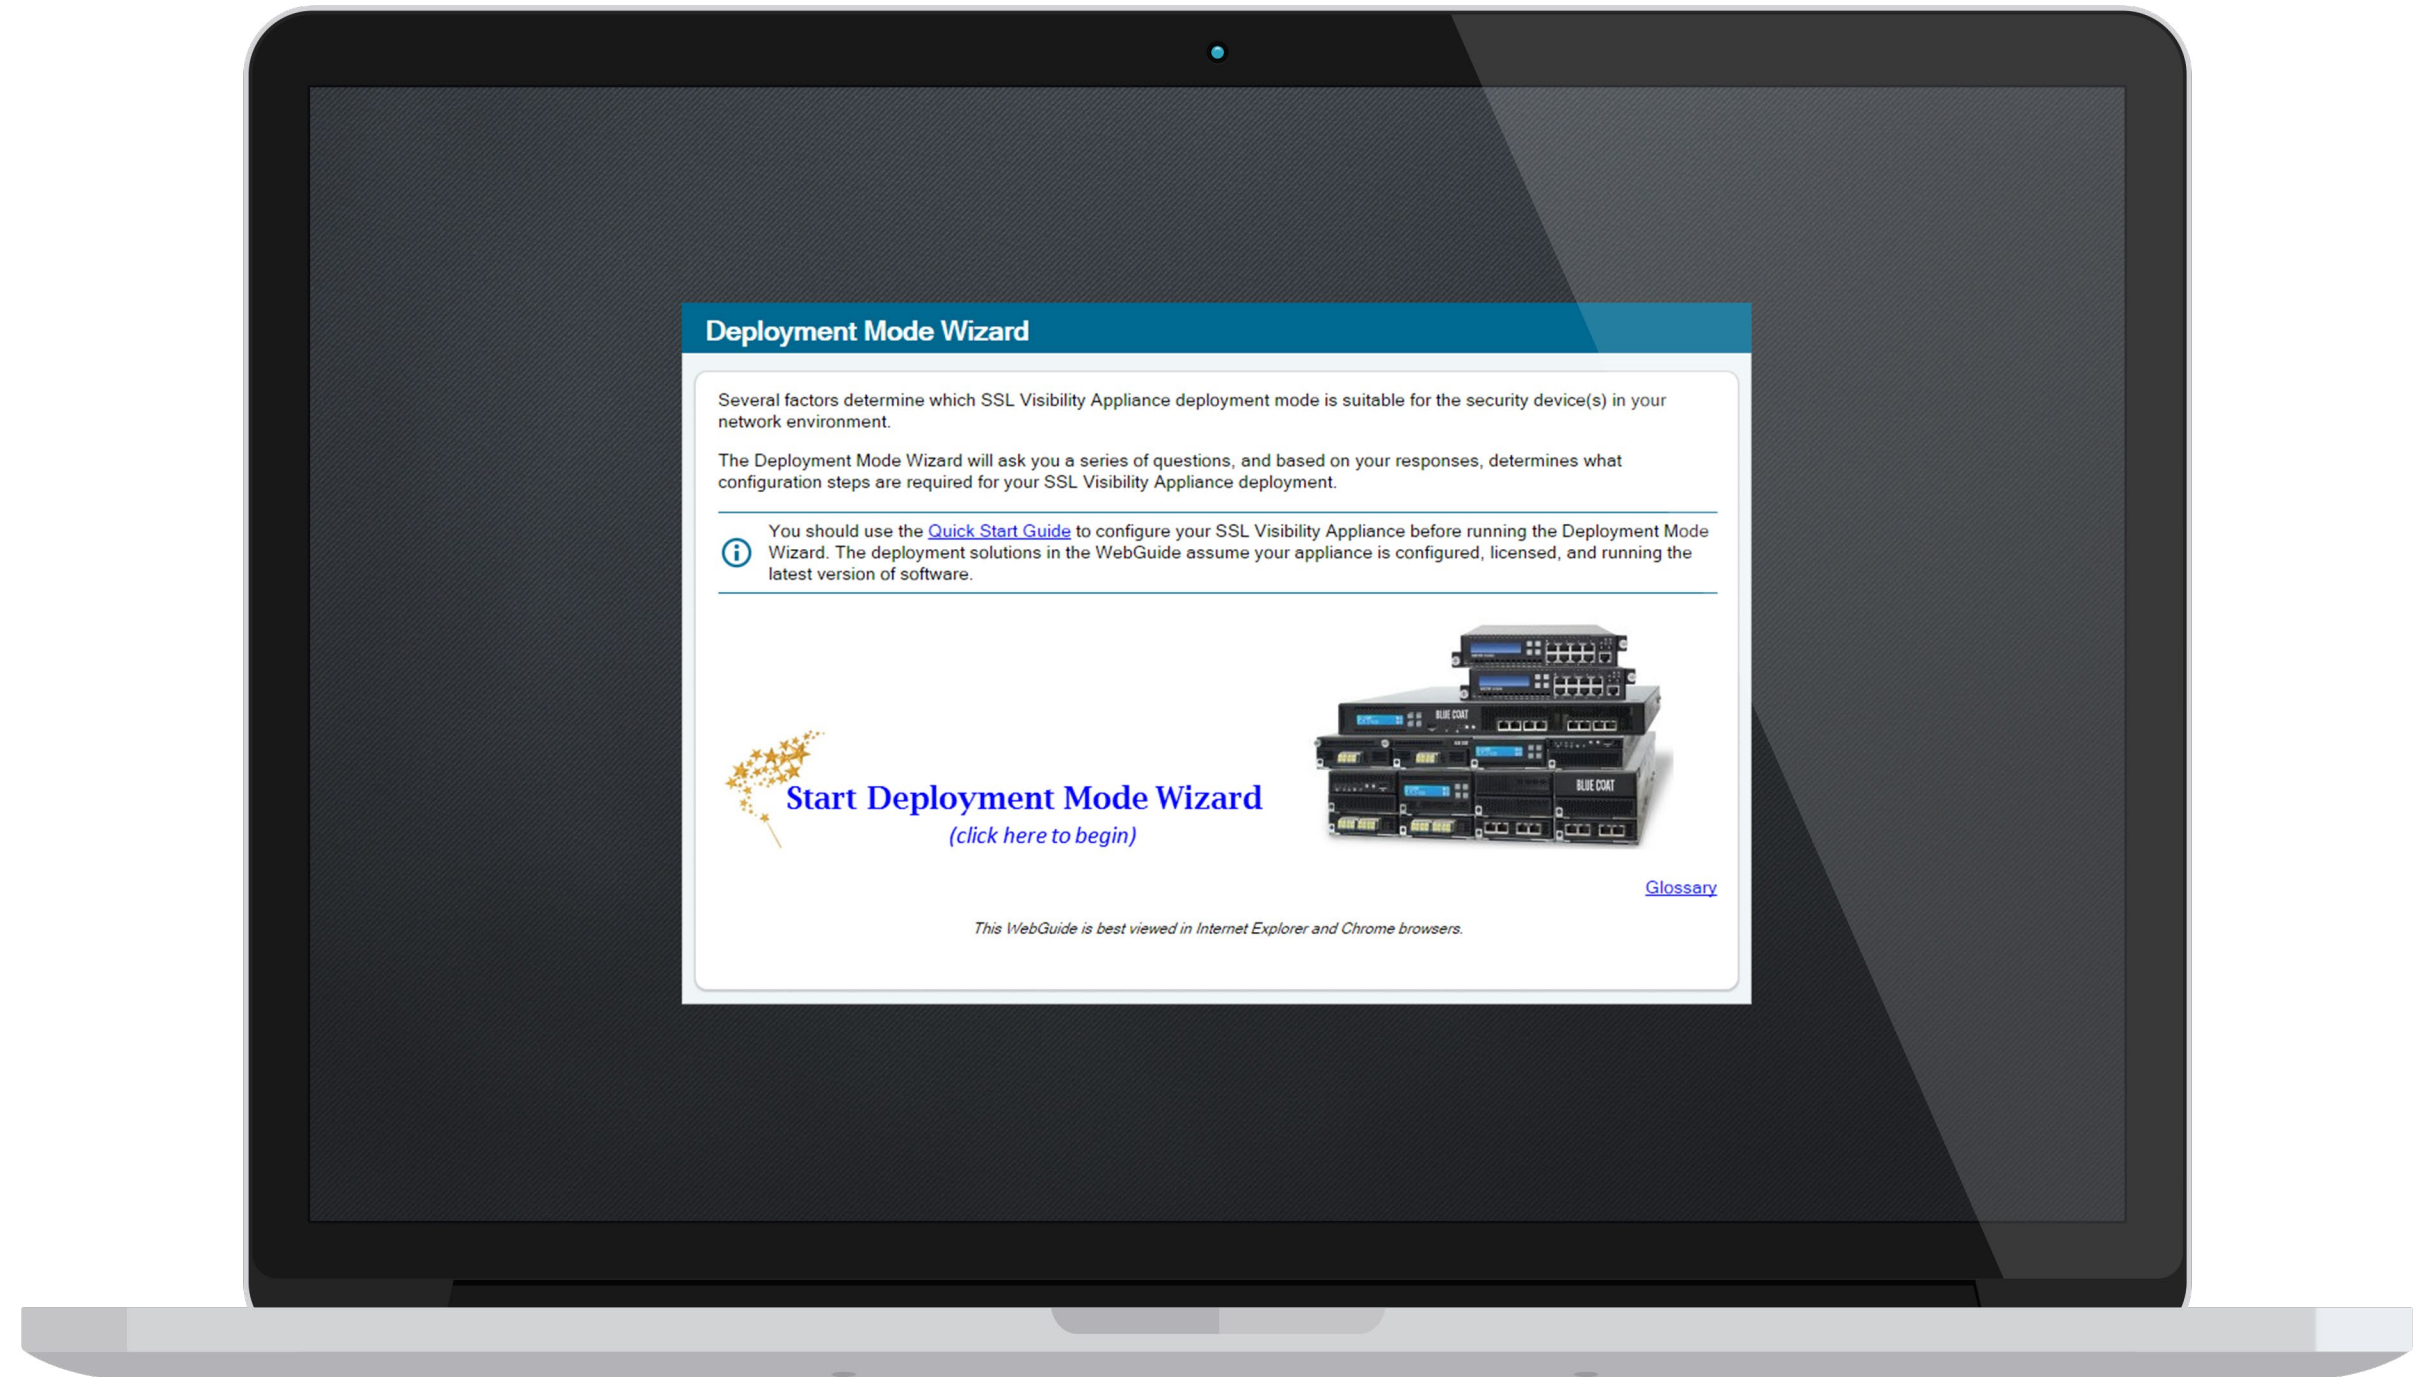

Two Flare master projects maintained by Blue Coat are the one created for the Blue Coat Web Security Service and another for an award-winning web-based deployment wizard.

Variables, skins and CSS editing are amazing features that allow me to generate the OEM versions of our guides within 30 minutes. This has been a real time-saver and would have been impossible to do without Flare.

Blue Coat Deployment Mode Wizard Created With MadCap Flare - Start Screen

STC Chicago Award-Winning Project with Flare

In 2015, Blue Coat’s Rebecca Altman used Flare 11 to create a deployment mode wizard included with the company’s “SSL Visibility First Steps WebGuide.” Since the documentation was so popular with Blue Coat employees and customers, Altman’s boss encouraged her to enter the project into STC’s technical communication competition. Her documentation received the highest level award.

The project was first initiated because the existing 200-page admin guide lacked end-to-end steps for each deployment option. Customers often called upon Blue Coat field engineers to help them, a time-consuming and costly process for the company.

Blue Coat’s World Wide Solutions Architect requested a wizard-like solution that would take users through a series of questions. Based on their answers, this wizard would provide a well-defined, compact list of steps for their particular deployment. Although wizards are typically created by coding software, the lead writer responsible for the project simply used MadCap Flare.

“I had to think outside-the-box to create a wizard in Flare. The solution was to create hyperlinked topics with MadCap Flare snippets to address the different branches that the wizard might take, depending on how users answered the questions,” explained Altman. This was possible, because there were only minor variations in the different types of deployment processes, and snippets removed the need to retype content. Extensive use of drop-down text, which collapses sections of text under links in the topic, ensured that users would not be overwhelmed when they looked at the screen.

Equally important, the use of top navigation in Flare provided a modern web look and feel. The result was an intuitive web-based wizard, built with Flare, which acted like a software program and directed users to the specific instructions they needed to deploy the appliance.

 The top navigation skin in Flare was just perfect for the wizard project. It really helped to provide a clean, intuitive and modern layout.

REBECCA ALTMAN
Principal Technical Writer | Blue Coat Systems Inc.

Deployment Mode Wizard: Select Type of Security Device

 What type of security device do you want to connect to your SSL Visibility Appliance?

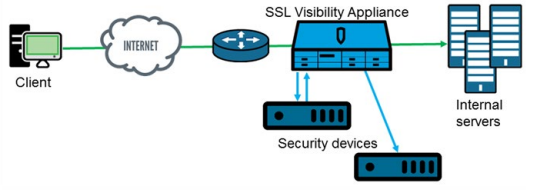

- My security device is an *active* appliance that is capable of blocking bad or non-compliant traffic: an intrusion prevention system (IPS), a next-generation firewall (NGFW), or an anti-malware/sandboxing solution deployed in IPS mode. [Proceed to next question](#)
- or
- My security device is a *passive* appliance that analyzes and sends alerts about inspected traffic: an intrusion detection system (IDS), a data loss prevention (DLP) appliance when deployed in detection-only mode, or a security appliance that performs security analytics and forensics and compliance analysis. [Proceed to next question](#)
- or
- I have a combination of security devices—an active appliance from the first list and a passive appliance from the second list (for example, an IPS and a Security Analytics appliance). [Proceed to next question](#)
- or
- [I want to use my SSL Visibility Appliance with a ProxySG appliance.](#)

[Glossary](#)

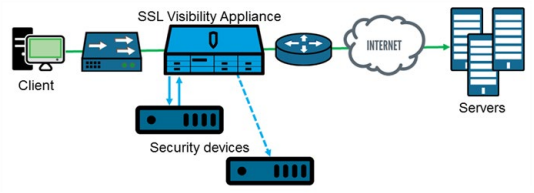

Deployment Mode Wizard: SSL Traffic Direction to Inspect

 For the security device you just selected, which traffic direction would you like to inspect?

- Inbound SSL Decryption:** Traffic originates from the Internet towards your organizational resources (Web Servers and Customer Web Portals). [Proceed to next question](#)

- Outbound SSL Decryption:** Traffic originates from inside your network to the Internet (Outbound Encrypted Internet Traffic - Encrypted Email, Social Networks, CRM, etc.). [Proceed to next question](#)

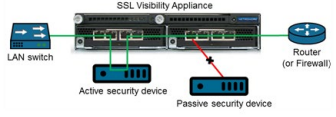

[Glossary](#)

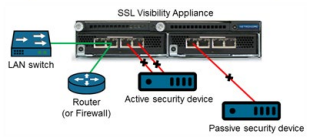

Deployment Mode Wizard: Select Failover Method

 If the SSL Visibility Appliance loses power, which failover method do you want to use?

- Fail-to-Appliance (FTA)**—results in traffic flowing through the attached active security device in the unlikely event of SSL Visibility Appliance failure. The security device can continue processing traffic, although without the benefit of SSL visibility.
Refer to the following deployment solution:
[Decrypt Inbound SSL Traffic for Active & Passive Security Devices \(FTA\)](#)

- Fail-to-Network (FTN)** — results in traffic bypassing the active security device in the unlikely event of SSL Visibility Appliance failure. The security device does not see or process any traffic; traffic goes through the SSL Visibility Appliance without being sent to the security device.
Refer to the following deployment solution:
[Decrypt Inbound SSL Traffic for Active & Passive Security Devices \(FTN\)](#)

[Glossary](#)

Blue Coat Deployment Mode Wizard Created With MadCap Flare - Question Screens

Decrypt Inbound SSL Traffic for Active & Passive Security Devices (FTA)

Follow the steps below to set up the SSL Visibility Appliance to decrypt inbound SSL traffic, and send it, and all other traffic, to attached active and passive security devices. In this deployment, if the SSL Visibility Appliance loses power, traffic will flow through the attached security device (fail-to-appliance). SSL servers are located inside the enterprise network, and their server keys and certificates can be uploaded to the SSL Visibility Appliance.

Active-Inline FTA Deployment Mode

1. Install the SSL Visibility Appliance in the network. See [Install SSL Visibility Appliance with Active & Passive Security Devices \(FTA\)](#).
2. Download the known server keys and certificates from internal servers and upload them to the SSL Visibility Appliance. See [Import Known Server Keys and Certificates](#).
3. Create a ruleset with a catch all action of cut through. See [Create Rule to Test Installation](#).
4. Create a segment for Active-Inline FTA mode, and add copy port(s) for passive security device(s). See [Create a Segment for Active-Inline Mode](#).
5. Test/verify that the SSL Visibility Appliance is not blocking traffic. Show the results via SSL Session log. See [Verify Installation \(Inbound\)](#).
6. Create a rule to decrypt everything from a specific source IP (your laptop). [Create Rule to Test Decryption \(Inbound\)](#).
7. Use the SSL Session Log to verify that the SSL Visibility Appliance is decrypting properly. See [Verify Decryption](#).
8. Delete the decryption testing rule, and create your own policies to define what traffic you want to decrypt, reject, or drop.

Flare really allowed me to experiment and create an innovative wizard that makes our web guide more user friendly.

REBECCA ALTMAN

Principal Technical Writer | Blue Coat Systems Inc.

"The top navigation skin in Flare was just perfect for the wizard project. It really helped to provide a clean, intuitive and modern layout," said Altman. "I also loved that I could have a screen without a traditional left navigation panel, since it provided a blank page that could be molded to have a wizard look and feel."

Altman added, "Flare really allowed me to experiment and create an innovative wizard that makes our web guide more user friendly."

Looking Ahead

As Blue Coat explores how to expand its use of Flare, Freeman and other Blue Coat technical writers have begun to incorporate Altman's award-winning wizard into other projects.

"Overall, I just love the Flare product and MadCap Software, and the people there really make you feel like you're part of the team," Freeman said. "Flare has helped us gain greater efficiency for ourselves, as well as help us rethink our content development and delivery. I look forward to seeing how we can continue to innovate working with MadCap."
